American Sovereign Bullion

A.I. WRECKED WORLD

YOU BETTER BEGIN PADDLING LIKE HELL. THE ERA YOU'RE USED TO IS CONCLUDING

A Personal Word Before You Read the Following

The acorn of this entire report is; economies do not create enough revenue to cover the costs of the country itself - globally.

You must truly let that sink in.

• So, therefore governments, because Nixon set the permission for this, print the money shortfall to pay bills they didn't receive enough money for

• Then, the costs of everything rise higher from the printing, inflation in its most evil version, while they save things financial, they kill the system itself

• Which forces demands for higher minimum wage, higher wages for the workers companies need. Workers must receive a minimum of earnings to cause them to show up at the job… cost rise, payroll costs must rise

• Rack that out for the last thirty years… and today everything is so expensive and so frustrating to deal with the final strike at the solution is:

  o Eliminate the cost to produce, everything. Eliminate the worker…

Artificial Intelligence replaces the cost side to production because it replaces what the cost is, the Worker itself…

• In theory, if the worker is replaced, then the government no longer has to print because the cost to create goods is practically zero

  o Except the fact the government gets its money from Production / Consumption; Sales Tax, Income Tax, Property Tax…

  o Once enough workers aren't earning and spending, the struggle increases mightily

'Courage is what it takes to stand up and speak; courage is also what it takes to sit down and listen.'

- Winston Churchill

You saw during COVID, just 20% of our US workforce was at home, the government printed nearly $9 trillion that year to hand out for spending within the economy. That was just a brief period of time, this is permanent.

Once just a skinny amount of global workforce is replaced by AI the model that supports human systems eating three times a day utterly fails.

¿How much money does AI spend in the economy?
Well, where did the government get its money? from Spending…
That is the point that is supported and explained in the next 4-51 pages..

We're not promising you a forecast. Nobody can. What we're showing you is a risk framework, a way of looking at your money, your retirement, and your legacy that takes seriously the possibility that the ground you're accustomed to standing on is about to shift violently.

If we're wrong, you'll still have made your finances stronger. Some savings will be decoupled from the world of growth-by-debt, more liquidity, and a hedge against currency troubles. If we're right, you'll have insulation from extreme change and upheaval.

And at this stage of life, do-overs aren't an available option, this is permanent alteration to the coded system.

The powers-that-be are deploying a force of change, utterly unchecked by the protective powers of government, that is targeted to think at 500 words per second and never forgets where the car keys are by late 2027. Humans think at 10 words per second…

What the Free Consultation Actually Is 46
Important Disclaimer and Source Notes 47
Endnotes 48

"By September 2027 A.I. Compute Power is Expected to Be 50x a Human... human brains think at 10 words per second, A.I. will think at 500 words per second! Are you really willing to bet that what you are used to will continue? Humans are putting something in charge of us, and your government has zero track record of delivering successful transitions to new frontiers..."

IT IS NOT ABOUT SMARTS, IT'S ABOUT AWARENESS

I struggle with something difficult. I've consulted on this topic with thousands of people, and the most common response I get is timidity.

We're not suggesting you finance condominiums on the moon to house SpaceX workers. We're suggesting you align your finances with your beliefs.

You express anger at the government for printing money, and yet, if you've read the reports, you know that printing is also the key ingredient in your retirement savings growing, approximately $32 trillion since 2008.

Most of us aren't exceedingly brilliant, cunning, or sophisticated. So it seems you settle into your grey, root for your kids, and hold disdain for the "successful", they musta gotten something you didn't.

But you did get a wonderful quality I call simplicity: the ability to build a life on assurances, and to mostly stay away from the high-risk, high-reward options that can level your future if they don't work out.

Honor that: $40 trillion in debt is a problem; and the loudest evidence that a problem needing $40 trillion to avoid it already exists.

How bankrupt is America? $40 trillion bankrupt. At $1,000 a second, one trillion dollars would take 310 years to produce. That's older than our country. And the total, $40 trillion, is 12,400 years of money, produced in mostly 26 years.

This is why AI is coming. It solves the catastrophe that mathematical awareness is painting for us. In life, I'd offer you this: there are two worlds. One is built from what others told you as soon as you could comprehend language, and built up further from what you eventually told yourself.

The other is the actual world. The inflection point is right here, your eyeballs, right here, on this word. Are you here, with your eyes? Or are you in your thoughts? Mathematics is not thought. It is architecture: born of the one thing architecture can never fail on: truth. So you were created with the power of choice, internal to you. Now you are magical. No other animal has a choice-making power like a human's.

Bill Gates *(love or hate him)* Rings Major Alarm Bells

In August 2026, Bill Gates published a long essay on his personal site, Gates Notes, laying out his most detailed public thinking on AI in three years. The tone is notably more alarmed than his past commentary on technology.

His core claim: AI won't behave like past waves of innovation, and the world currently has no real plan for the disruption it's about to cause.

Gates's reasoning starts with why he thinks the comparisons people usually reach for, the printing press, the PC, the shift from farms to factories, don't hold up. Those transitions took decades or generations, gave workers time to retrain, and mostly created new categories of work that still required a human mind.

AI is different on two counts, he argues: it doesn't need people to adapt to it, because it already speaks natural language and runs on devices people already own; and it doesn't just assist human cognition, it substitutes for it.

That combination is why he expects the disruption to play out over roughly a decade rather than a generation, and to hit white collar and blue-collar work at the same time rather than one sector giving way to the next.

He lays out three specific risks he wants people paying attention to: Jobs disappearing permanently. Gates draws a comparison to the Great Depression, when unemployment hit roughly 25 percent and stayed in double digits for close to a decade , but notes that cycle eventually reversed as demand and investment came back.

His concern with AI is that the jobs it displaces may not come back the same way, because the roles most exposed are entry- and mid-level, while the new roles being created tend to require years of specialized skill to reach. He points to early evidence already showing younger workers losing ground in AI-exposed fields while older, more experienced colleagues haven't seen the same effect.

He expects this to eventually extend past white-collar work into physical labor too, as robotics costs fall , pointing to construction and hospitality as industries likely to feel it before the end of the decade.

AI makes it easier to cause harm. Gates argues that AI lowers the skill floor required to do damage , that people with very limited technical ability will be able to run scams, generate disinformation and deep fakes, or exploit software vulnerabilities at a scale that used to require real expertise. He's specifically worried about critical infrastructure, hospitals, power grids, financial systems, benefit-payment systems , because the people who ultimately bear the cost of an attack on those systems are ordinary patients, customers, and recipients, not the institutions themselves.

Power concentrating further at the top. The same tools that make it easier for a lone bad actor to cause harm also make it easier for governments and large institutions to consolidate control , he points to autonomous weapons systems and large-scale opinion manipulation as examples. And looking further out, he raises the possibility that AI systems themselves may eventually act in ways their own designers didn't intend, as capability advances faster than anyone anticipated.

Gates frames the whole essay around a single question: whether AI ends up being, in his words, "the greatest equalizer ever invented, or the worst source of injustice." He's explicit that he doesn't think either outcome is guaranteed , it depends on decisions made now, and he's on record saying he doesn't currently see evidence that leaders or institutions are preparing adequately.

American Sovereign Bullion

Necessity is the Mother of All Invention
Necessity's Creation is A.I.

Core Failures That Must Be Reckoned
1. The world is carrying more debt than it ever has.

Global debt, government, corporate, and household borrowing combined, hit a record $348 trillion at the end of 2025, according to the Institute of International Finance. [1]

That's roughly 305% of world GDP by the IIF's count, or as high as 332% using the IMF's Global Debt Database.

* Either way, the number has never been higher, and it's grown by tens of trillions of dollars in the last two years alone.

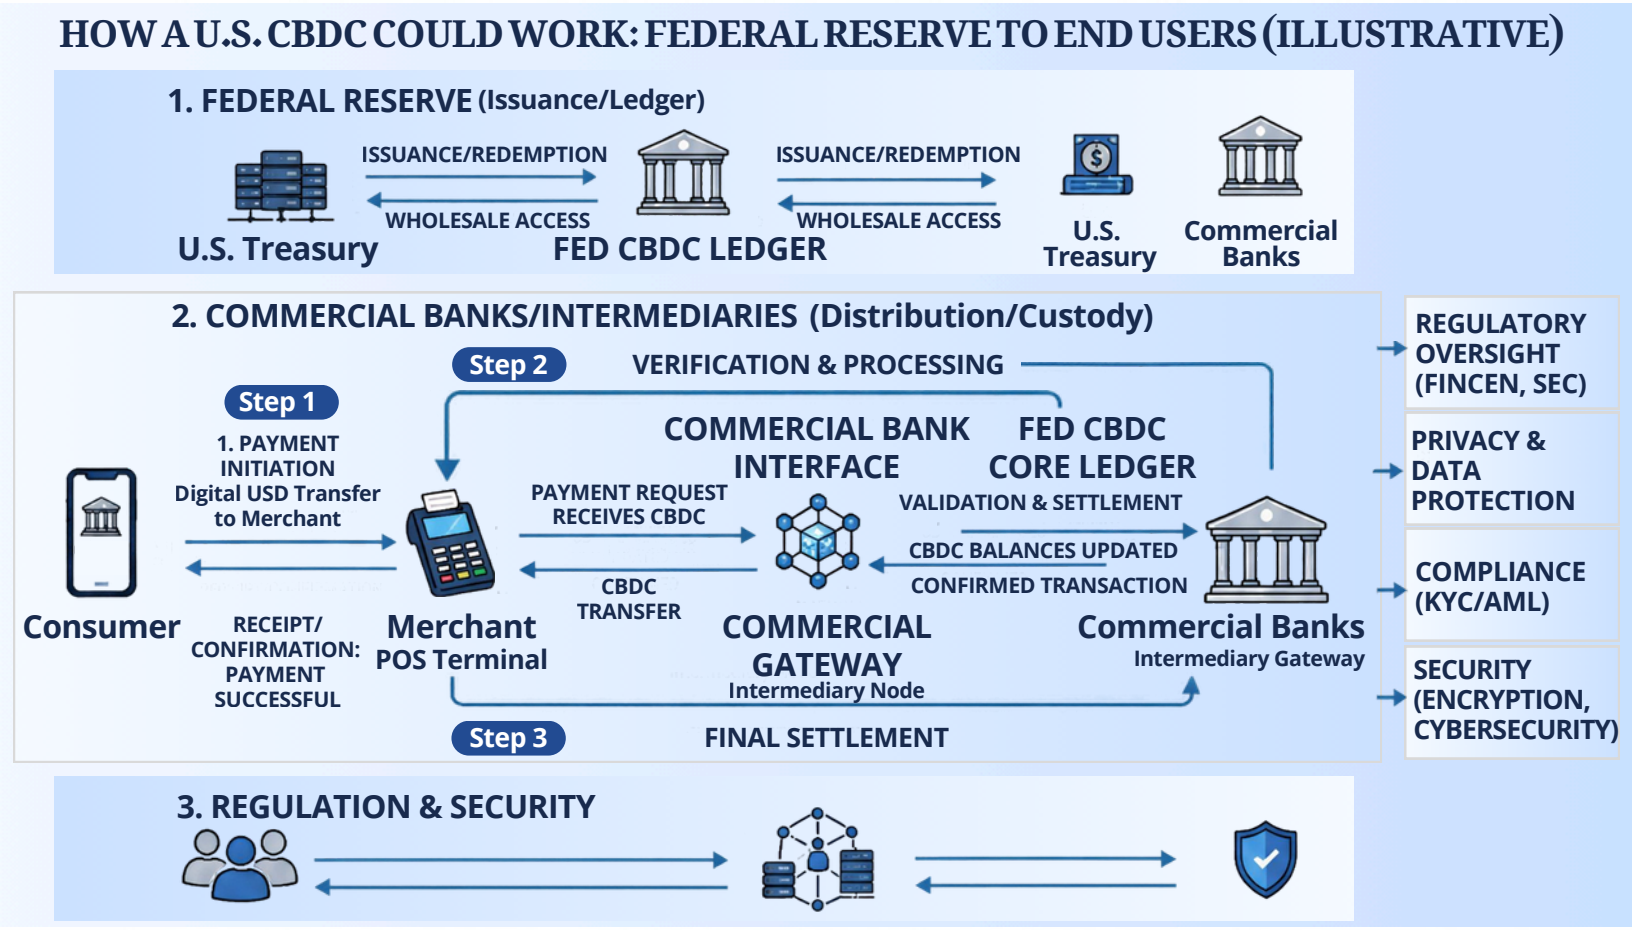

What that means in practice: governments have less room to respond to the next shock, whether that's a recession, a banking scare, or a wave of AI-driven job losses, without leaning even harder on borrowing and money creation.

2. Governments are already experimenting with programmable digital money.

As of 2026, around 40 central banks around the world have active pilot programs for Central Bank Digital Currencies, government-issued digital money, as opposed to the commercial bank deposits and physical cash most people use today. That's out of 146 countries exploring the idea in some form, representing the vast majority of the world economy. [2]

Some of these pilots include programmable features, rules that can restrict what the money can be spent on, or how long it can sit unspent before it expires. None of that is available at scale in the U.S. yet, but it's no longer a hypothetical anywhere in the world. It's an active, funded area of central bank research and testing.

Humans cannot see around corners, but AI is looking down...
AI cannot simply “delete” or single-handedly erase the global debt crisis, but it can drastically reshape fiscal efficiency; conversely, AI is the exact technological engine required to make programmable digital money functional at scale.
While AI cannot magically fix the structural and political choices that drive massive borrowing, it can optimize how governments manage revenue and respond to economic shocks. When it comes to Central Bank Digital Currencies (CBDCs), AI acts as a double-edged sword—serving as both the ultimate enforcement mechanism for programmable money and a powerful predictive tool to prevent economic crises.

Visualizing the Macro Landscape

The intersection of massive sovereign debt and programmable digital money creates a high-stakes economic environment. Below is a breakdown of how AI can be applied to both situations, along with the inherent risks.

Situation 1: Rectifying the $348 Trillion Global Debt Crisis

AI cannot rewrite fiscal policy or force governments to spend less, but it can act as an unprecedented efficiency engine to maximize existing resources and minimize the damage of the next economic shock.

How AI Helps

Hyper-Efficient Capital Allocation: AI algorithms can analyze vast datasets to identify wasteful government spending, bureaucratic redundancies, and structural inefficiencies. By streamlining public sectors, governments can reduce the need to borrow for operational costs.

Automated Tax Compliance & Revenue Optimization: Governments lose trillions annually to tax evasion and complex loopholes. Advanced AI models can audit financial footprints globally, closing revenue gaps without requiring legislated tax hikes.

Predictive Crisis Mitigation: Instead of reacting to a banking scare or a recession after it happens (which forces massive, emergency debt creation), predictive AI can model economic vulnerabilities in real-time. This allows central banks to execute micro-interventions before a full-blown crisis erupts.

The AI Paradox

As noted above, a major risk factor is AI-driven job losses. If generative AI and automation displace large segments of the workforce, income tax revenues will plummet while demands on social safety nets will spike. This could ironically force governments to borrow even more money in the short term to fund safety nets like Universal Basic Income (UBI).

Situation 2:

Managing Programmable Digital Money (CBDCs)

Programmable money is functionally impossible to manage at scale without AI. A central bank cannot write manual code for millions of citizens' daily transactions; it requires automated, intelligent systems.

How AI Helps

- **Dynamic Macromonetary Tuning:** Instead of central banks blindly raising or lowering interest rates for the entire economy, AI paired with a CBDC allows for targeted, real-time adjustments. For example, if a specific sector is flagging, an AI could program a temporary "expiry date" on stimulus funds distributed to that sector to force immediate consumer spending.

- **Fraud and Cyber Defense:** Moving the global financial system to digital, central bank-issued rails invites massive cybersecurity risks. AI models are essential for detecting anomaly patterns, predicting network exploits, and preventing systemic hacks.

The Critical Risk Factor

The fusion of AI and programmable money introduces severe risks regarding financial autonomy and central planning errors:

- **Algorithmic authoritarianism:** If money is programmable, an AI could be tasked with enforcing government mandates. It could automatically restrict a citizen's ability to buy certain goods (like fuel or imported products) based on carbon footprints, political standing, or social credit.

- **The "Black Box" Economy:** If an AI model incorrectly miscalculates economic data and automatically triggers an expiration or restriction on money supply, it could cause localized panics or accidental liquidity crunches before human regulators can intervene.

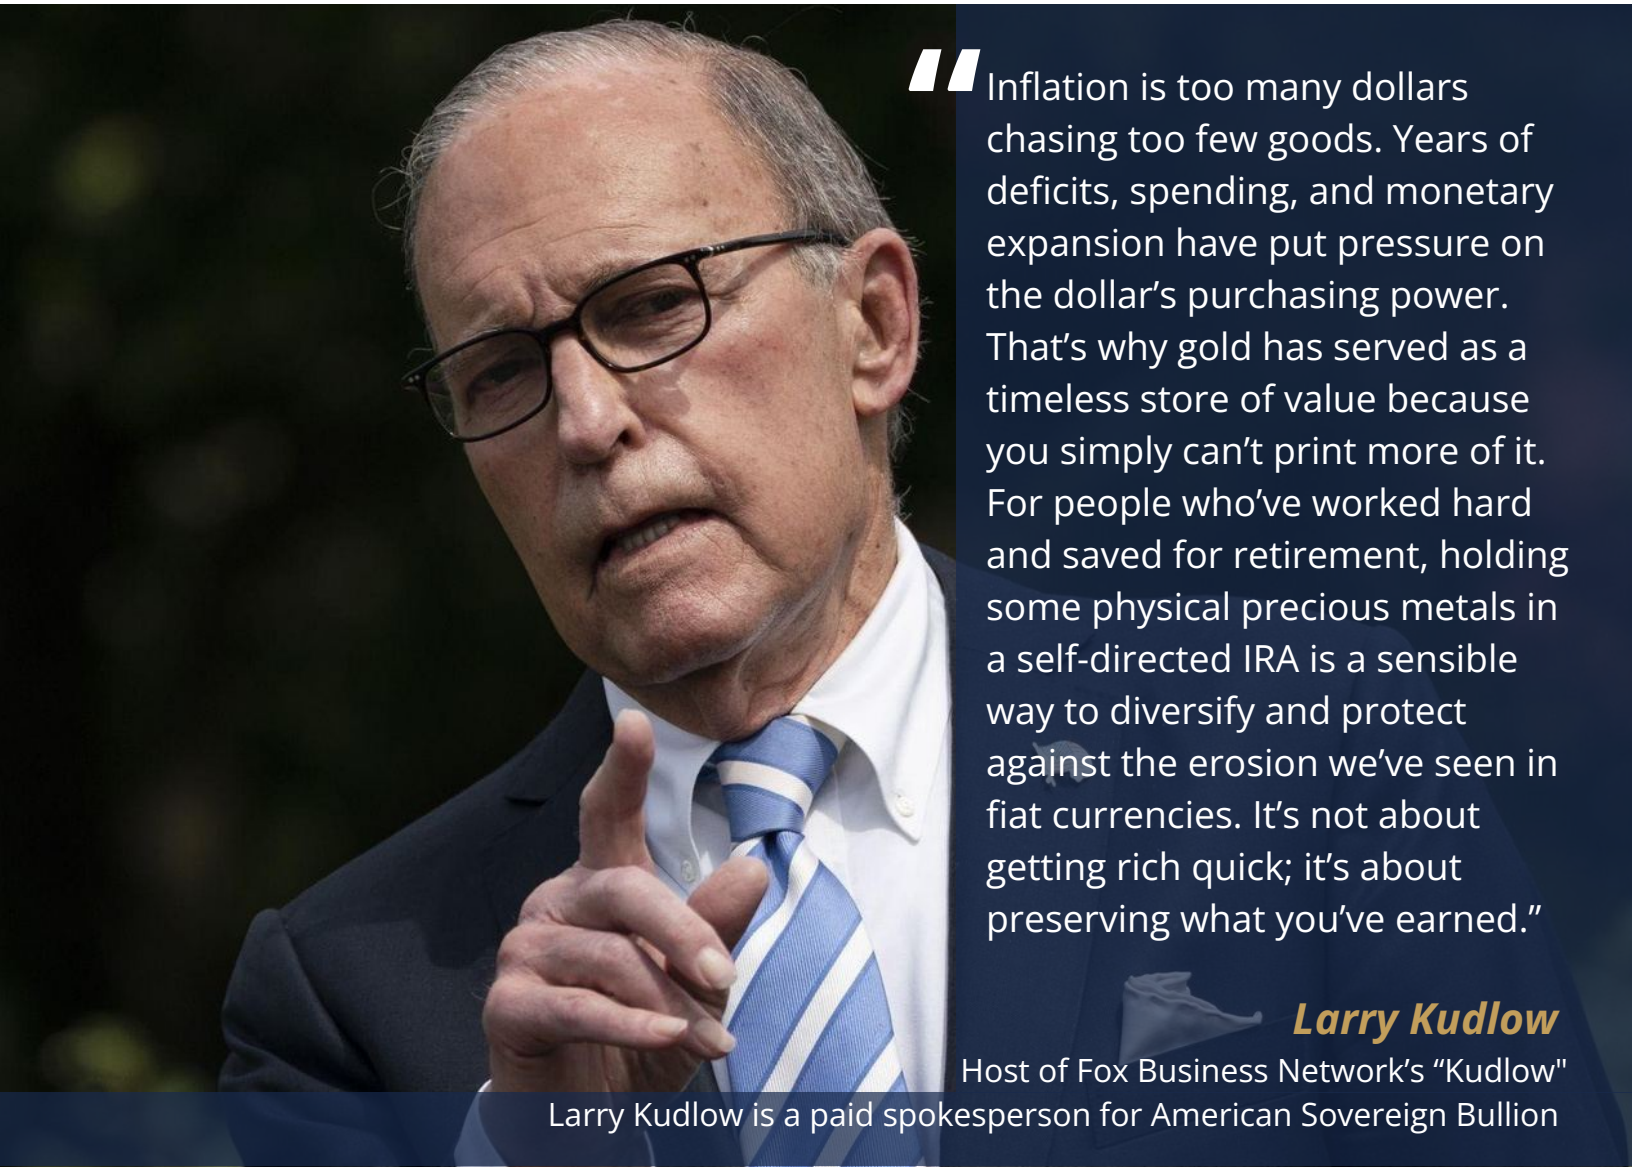

3. Some of the world's largest economies are aging faster than they can replace their workers.

South Korea's fertility rate has fallen to roughly 0.72 children per woman, the lowest in the world, and less than a third of the 2.1 needed just to hold a population steady.[3] It's an extreme case, but not an isolated one: the global fertility rate has fallen to around 2.3, edging toward the replacement line worldwide.[4] Japan, Italy, and much of Western Europe face a similar, slower version of the same math, fewer working-age taxpayers supporting more retirees for longer.

That trend predates AI entirely. What this guide argues elsewhere is that AI-driven job displacement would land on top of it, not instead of it, straining the same pension systems and tax bases from two directions at once.

Artificial Intelligence (AI) is rapidly emerging as a critical macroeconomic cushion to soften the financial blow of demographic decline. As major world economies face a severe labor shortage due to rapidly aging populations and falling birth rates, the cost of supporting retirees is skyrocketing.

"Inflation is too many dollars chasing too few goods. Years of deficits, spending, and monetary expansion have put pressure on the dollar's purchasing power. That's why gold has served as a timeless store of value because you simply can't print more of it. For people who've worked hard and saved for retirement, holding some physical precious metals in a self-directed IRA is a sensible way to diversify and protect against the erosion we've seen in fiat currencies. It's not about getting rich quick; it's about preserving what you've earned."

Larry Kudlow

Host of Fox Business Network's "Kudlow"

Larry Kudlow is a paid spokesperson for American Sovereign Bullion

INTERRUPTING, for a moment...

You, can and do think, whatever that is- as is mine, is limited however, humans cannot see around corners, but A.I. is looking down.
Simply as it stated, so shall at least to a likely major level, and both converge at the same time; AI reducing consumption (analog) side to the economy, and it's not like biting an apple and you still have whatever's left of the apple. A few bites out of the "economic apple" and you don't have anything. Pulling a critical piece, one piece out of the Jenga tower, and all the pieces are in a pile.

And the death of the fiat currency system- perhaps by exhaustive dollar evisceration, but certainly by the rejection side this scenario defines would happen, that in-affordability causes inoperability meaning, most everything breaks, most everything stops. The flow of money is no more.

- What saves humanity - quite dramatic, will have to be by the nonnegotiable insistence in physics based existence that as a snake can't give birth to a bird, analog must be what saves analog. Gold is analog as is human existence.

- For all of our time here, since the Egyptians, except the last thirty or so years, it's been: spend some of your Human exerted Energy for a Financial Energy benefit. HE for FE.

- Only a basis for conducting exchanges, a currency, rising in value can be what saves humanity from being relegated to second class by AI - and the coinciding financial hardship of inoperability within 3 years from now.

- The autonomy needed is provided by finance and true financial resource, by design, independent of all conditions is gold and silver.

- The world is showing you it no longer works on standards, it works on immediacy.

An embedded AI retirement scenario...

Where artificial intelligence automates just 25% of the workforce and requires the government to fund a universal retirement or basic income system (via enormously more printed dollars) would radically disrupt traditional economic models. Central banks would shift from managing interest rates to managing structural deflation and resource access, while global wealth inequality would deepen drastically between AI-owning nations and labor-dependent economies unless unprecedented international wealth-redistribution frameworks are established.

The Process of Erosion

- **The Death of the Phillips Curve:** Central banks can no longer use the relationship between unemployment and inflation to guide policy, as labor becomes decoupled from production.
- **Combatting Permanent Deflation:** Massive AI productivity gains will drive the cost of goods and services near zero, forcing central banks to permanently fight structural deflation rather than inflation.
- **Negative Interest Rates and CBDCs:** Central banks may deploy Central Bank Digital Currencies (CBDCs) with programmable expiration dates or deep negative interest rates to force capital circulation and discourage hoarding.
- **Redefining "Money Supply":** Instead of targeting commercial bank lending, monetary policy could directly integrate with fiscal policy to fund universal citizen payouts.

"Folks, all of this analysis is the result of asking questions. The questions always mean more than the answers."

The 2030 Labor Shock

The rest of this section models one specific, clearly-labeled assumption , that AI automation pushes roughly 25% of the global workforce into retirement or displacement by 2030 , to explore what it would do to monetary policy and global inequality. It is a modeling assumption, not a forecast we're asserting as fact.

Under that assumption, roughly 800 million to 1 billion workers would be removed from active production within a few years, an unprecedented structural shift.

Accelerated Impact on Central Bank Monetary Policy

A compressed timeline like this would deprive central banks of the cushion of a gradual, multi-decade demographic transition. They would need to shift from managing business cycles to executing emergency structural stabilization.

- **Emergency Fiscal-Monetary Fusion:** central banks might need to directly monetize the state's automated safety nets to avoid near-term insolvency.
- **The "Velocity of Money" Collapse:** a sudden 25% loss of labor income could collapse consumer spending and the velocity of money, prompting central banks toward deeply negative interest rates to discourage cash hoarding.
- **Hyper-Targeted CBDC Distributions:** central banks could use programmable digital currency to direct conditional, expiring funds toward consumer spending rather than dormant savings.
- **Asset Allocation and Yield Curve Control:** to avoid a crash in pension markets, central banks might expand asset purchases, effectively nationalizing a portion of market risk.

Our current economic model runs on consumer spending, which is exactly the mechanism this assumption stresses.

Likely Outcomes From the Assumption: AI Retires 25% of Global Workforce by 2030

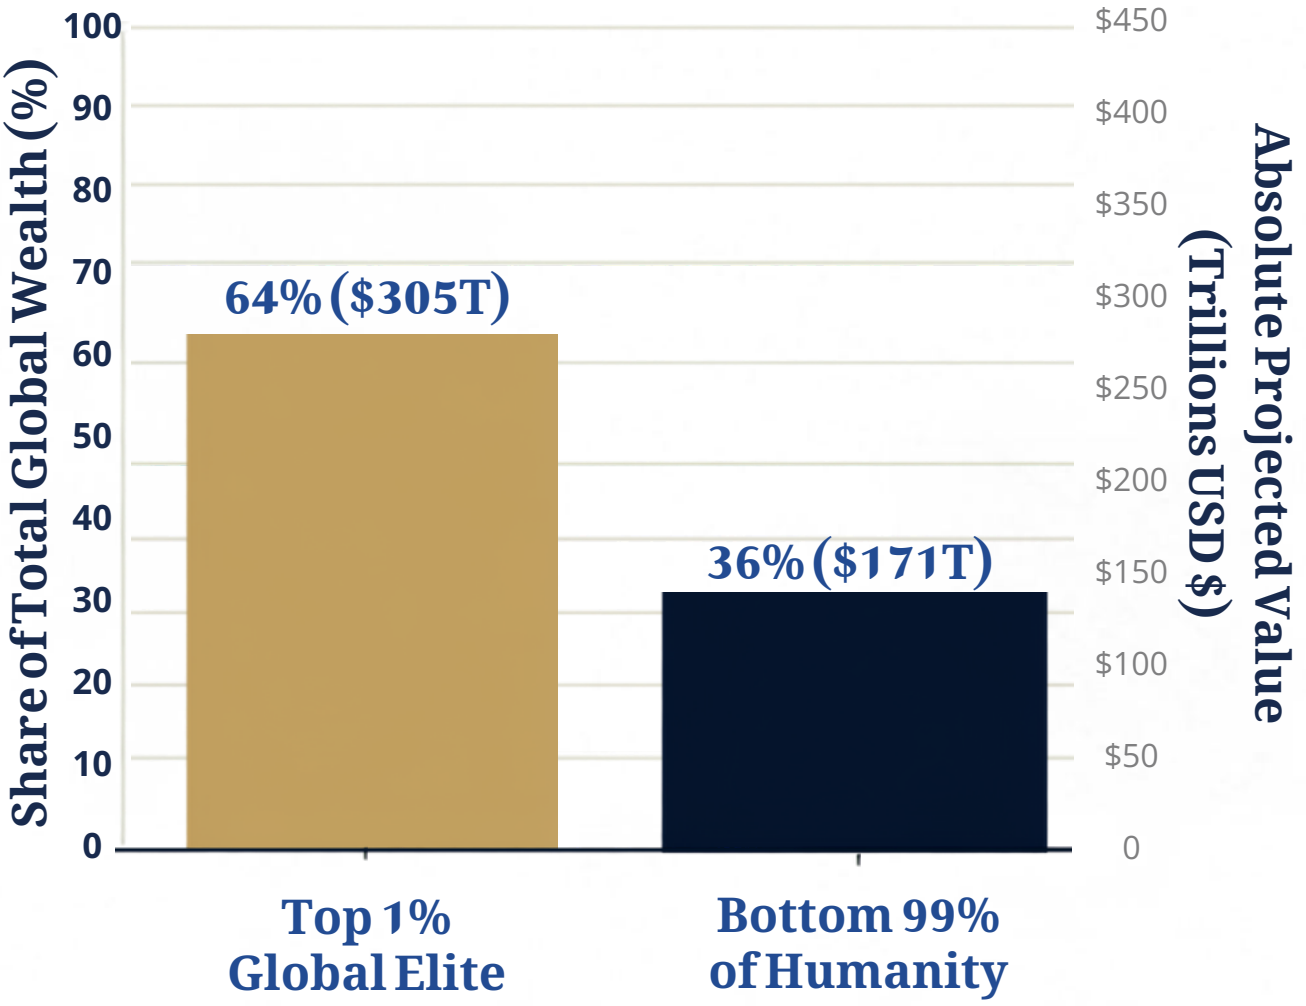

Under this same illustrative assumption, central banks would face a difficult policy dilemma: the financial system's plumbing strains when a quarter of the consumer base stops consuming.

Reshaping Global Wealth Inequality via Consumption

A consumption shock of this size would create a sorting mechanism between nations, based on who captures automated profit margins.

Economic Metric	Sovereign AI Core (e.g., US, Tech Giants)	Labor-Exporting Periphery (e.g., Emerging Markets)
Corporate Profit Realignment	High-tech firms could see wider margins as labor costs fall, even with a smaller consumer market.	Traditional manufacturing and service firms could struggle as export demand falls.
Sovereign Subsidy Capacity	Could levy “automation taxes” on software giants to subsidize displaced domestic consumers.	Without domestic AI firms to tax, funding safety nets for displaced workers would be harder.
Currency Valuation	Domestic currency could strengthen if capital flees into AI-related assets and infrastructure.	Local currencies could weaken, making imports more expensive for citizens.

Projected Global Wealth Concentration

Under this scenario, wealth inequality would shift from a measure of what people earn to what people are able to consume, a dynamic worth watching regardless of whether the 25%-by-2030 assumption proves accurate.

Which Introduces a Possible Emergency Justification for CBDC

1. The Breakdown of Interest Rate Transmission

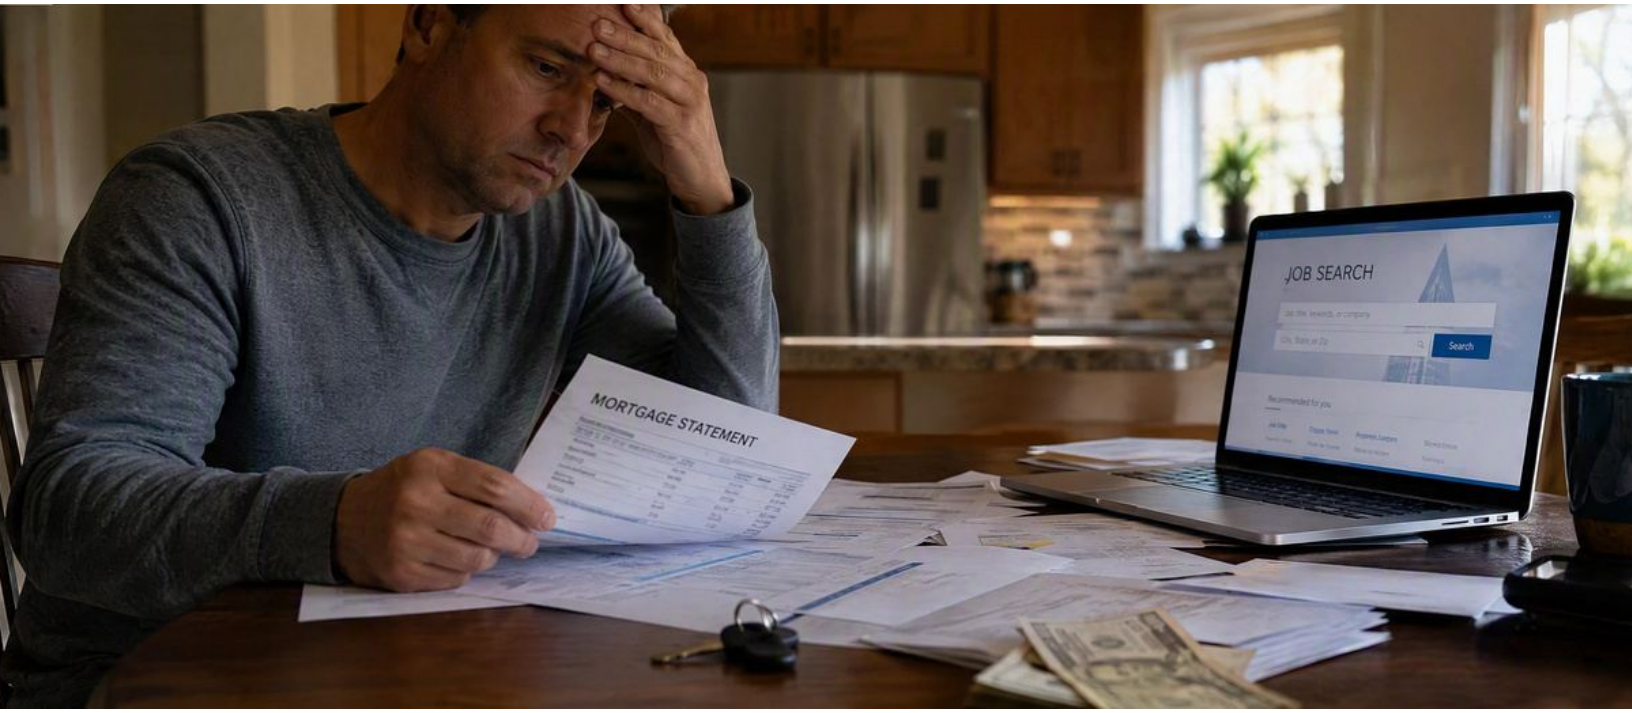

Lowering interest rates normally encourages commercial banks to lend and consumers to borrow. But a consumer living on a bare minimum AI stipend cannot qualify for a mortgage or an auto loan, and has little incentive to borrow. Monetary policy could become far less effective through this traditional channel.

2. Universal Programmed CBDC Distributions (Velocity Targets)

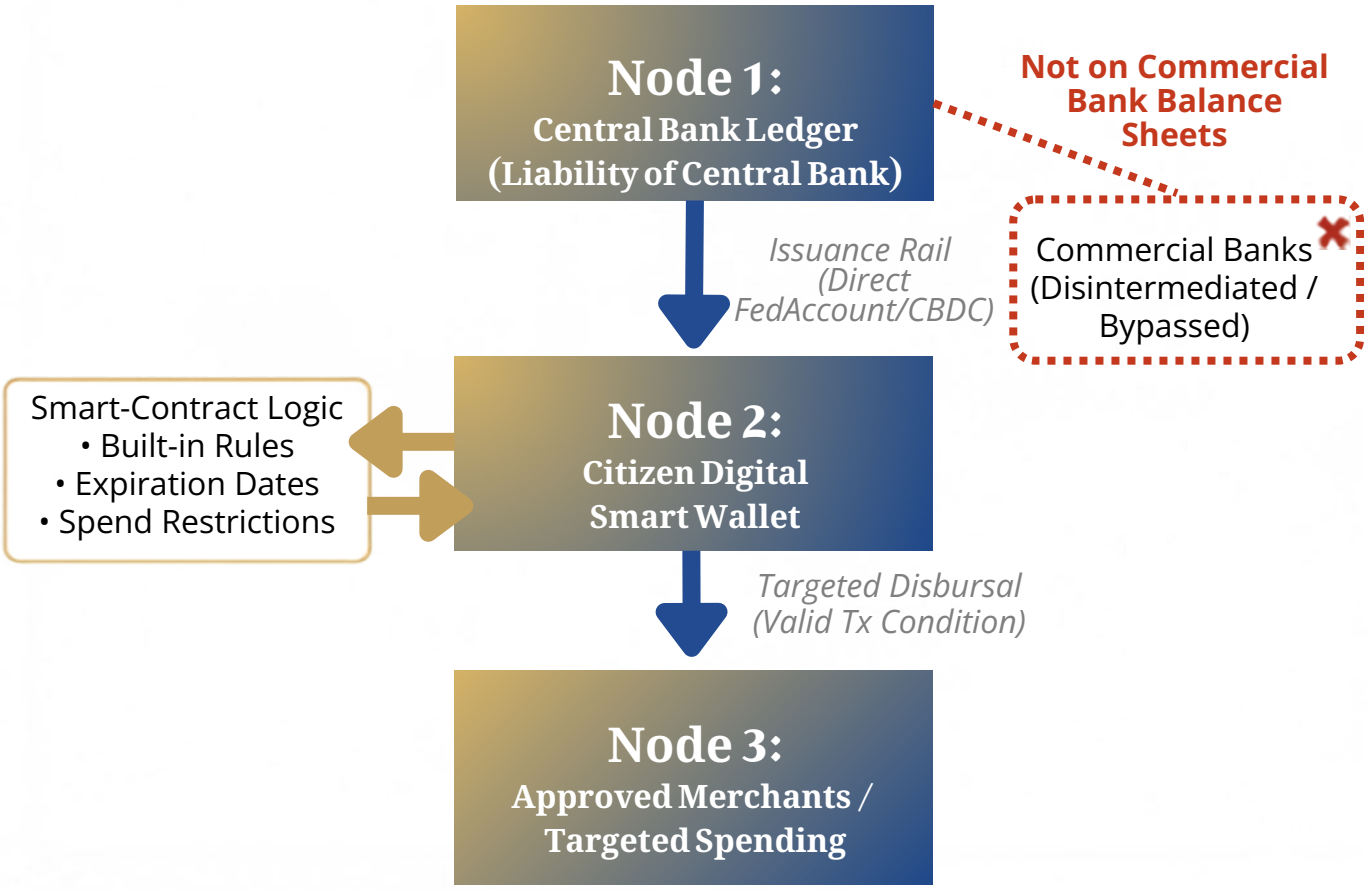

To counter a spending freeze, central banks could in theory bypass commercial banks using programmable Central Bank Digital Currencies:

- Expiration Dates: stimulus funds could carry hard expiration dates (e.g., “must spend within 30 days”) to encourage near-term spending.
- Merchant Restrictions: funds could be restricted to specific sectors, local retail, domestic manufacturing, or hospitality, to target support toward struggling consumer industries.

Here is how such a system could plausibly be engineered, described as a design exercise rather than a policy we're predicting will happen.

Programmable CBDC Stipend Architecture

Illustrative System Architecture

A programmable CBDC stipend like this would likely run on smart-contract logic built into individual digital wallets managed directly by the central bank, bypassing commercial bank balance sheets.

- The Monthly Issuance: a fixed dividend is issued on day 1 of the month to a citizen's verified digital wallet.
- A Decay Curve (Demurrage): any unspent balance from that month's issuance could begin losing value after a set date, to discourage hoarding.
- Sector Whitelisting: the currency could carry metadata restricting it to categories like groceries, utilities, and healthcare , rejecting spend on speculative assets or imports.
- Instant Settlement: on a valid purchase, tokens would convert into ordinary, unrestricted funds in the merchant's account, allowing normal business operations.

This kind of "demurrage" currency, money engineered to lose value if unspent, is a real concept discussed in monetary economics, not something we invented for this guide; it just hasn't been deployed at this scale.

Macroeconomic Trade-offs of a System Like This

Feature	Potential Benefit	Potential Inequality Risk
Negative Yield (Demurrage)	Keeps money moving, supporting revenue for essential consumer goods.	Could structurally block the lower class from building savings or generational wealth.
Merchant Rules	Could keep capital circulating domestically, protecting local industry.	Could let politically connected corporations capture a disproportionate share of consumption.
Direct Core Settlement	Bypasses commercial banks, reducing bank-run risk.	Could create two permanently separate financial classes: one using decaying tokens, one using ordinary compounding capital.

The bottom line: a programmable, decaying digital currency is a coherent design response to the scenario this guide describes, but it comes with real structural trade-offs for savers and small businesses that any serious version of this policy would have to address.

If This Scaled to a Universal Basic Income (UBI)

If a mechanism like this scaled from a targeted safety net into a true Universal Basic Income, issued to all citizens regardless of employment , the programmable currency would effectively become the primary circulatory system of the national economy.

- A Two-Tiered Monetary System: a circulating, decaying UBI token for consumption, alongside ordinary, non-decaying currency earned through work or asset ownership.
- Addressing the Inflation Critique: traditional UBI proposals face the criticism that printing cash for everyone just drives prices up. A programmable version could, in theory, cap purchasing power dynamically if a sector's prices rise past a threshold.
- No Capital Accumulation: because the token decays and can't buy investments, it represents spending power without the ability to compound, recycling money back into the real economy rather than into assets.

On a global scale, a system like this would tend to fracture international trade, an AI-wealthy nation could code its tokens to reject foreign merchants, cutting developing nations off from that consumer market entirely. That's a real, worth-flagging downside of the approach, not just an upside.

Why We Wait

- Energy saving: Your brain wants to save energy. Staying the same takes less work than building a new path.
- Fear of risk: Acting before a crisis feels dangerous. Waiting feels safe until the problem arrives.
- Blind spots: Slow changes are easy to ignore. We only notice them when they become loud and urgent.

The Cost of Reacting Late

- Less control: When you wait, outside events make choices for you.
- High stress: Last-minute changes cause panic.
- Wasted time: Fixing a broken system takes much more work than updating a working one.

How to Shift from Reaction to Action

- Choose early pain: Accept small, easy adjustments now so you can avoid hard, painful shocks later.
- Look for small signs: Notice small shifts before they turn into big problems.
- Change on purpose: Try small new habits every day.

We at American Sovereign Bullion have always suggested with most things in life that need choices made: “you can accept the discomfort caused by making a choice from the evidence of the difficulty to come, or you can experience the discomfort caused by the difficulty once it arrives.”

PART 01

What You Need To Know About Your IRA, 401(k), and TSP

This is the most important part in the guide for anyone over 50. Read it carefully.

Most Americans approaching or in retirement have the majority of their net worth in three kinds of accounts: a traditional or Roth IRA, an employer-sponsored 401(k) (or 403(b), if you worked in education or healthcare), and, if you spent time in federal service or the military, a Thrift Savings Plan.

These accounts have one thing in common. Almost all of the money inside them is invested in paper assets: stocks, bonds, and mutual funds. Which means almost all of it is exposed, in some form, to the kind of AI-driven economic shock the rest of this guide describes.

Most people in or near retirement don't know they have options. Here's what you should know , before you read the rest of this guide, so you understand the rest of this guide is solvable.

WHAT MOST RETIREES NEVER HEAR

You can move a portion of your IRA, old 401(k), or TSP into physical gold and silver, without paying a dime in taxes or penalties.

It's called a self-directed precious-metals IRA. It's been an IRS-recognized account structure since 1997.[5] And it's the option most retirees are never told exists.

Here's how it works

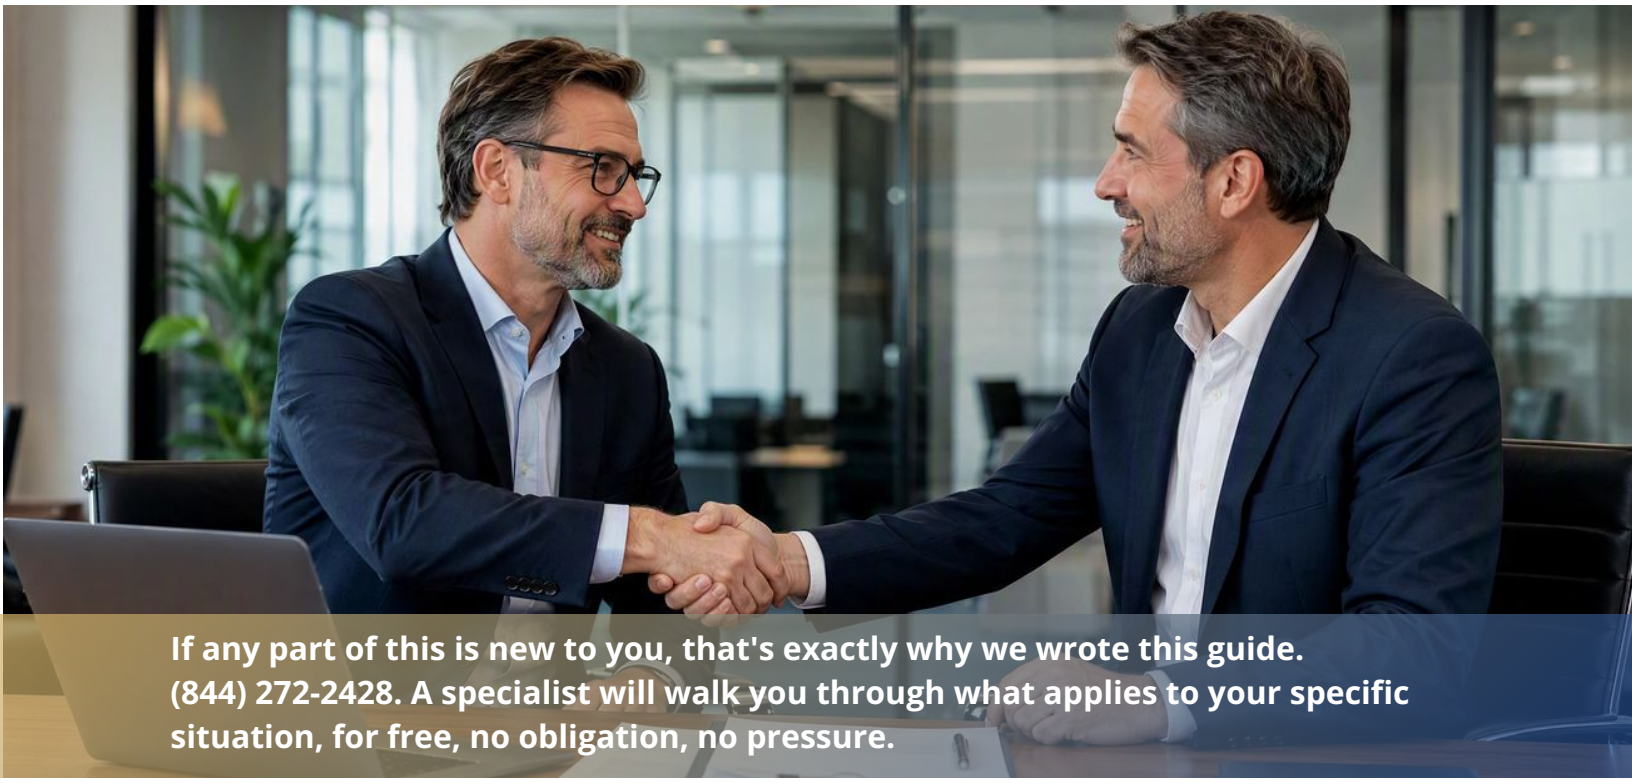

1. You aren't taking a distribution. You aren't cashing out. You're moving assets between qualified accounts. This works for traditional IRAs, Roth IRAs, SEP IRAs, old 401(k)s from previous employers, and most TSPs. Done correctly, and we do this every day, there is no taxable event. The specialist will walk through the right path for the specific accounts you have.

2. The gold and silver in a precious-metals IRA is physical, not paper. No ETFs. No certificates. Actual bullion, in your name, held at an IRS-eligible, non-bank depository.

3. Required Minimum Distributions still apply, but they don't force you to sell. Once you turn 73, the IRS requires minimum distributions from a traditional IRA.[6] With a precious-metals IRA, that can be taken in cash or, in some cases, by taking physical delivery of metals. (Roth IRAs don't have RMDs at all.)

4. Inheritance is straightforward. Physical bullion passes to your heirs through your beneficiary designation, the same way any IRA passes.

5. Your financial advisor probably can't help you with this, and that's not a knock on your advisor. Most financial advisors are licensed to sell securities, and physical precious metals aren't securities.

If any part of this is new to you, that's exactly why we wrote this guide. (844) 272-2428. A specialist will walk you through what applies to your specific situation, for free, no obligation, no pressure.

RECESSIONS BEGIN DURING RALLIES

PART 02

Why Your Brain Is Lying to You Right Now

Let me ask you something.

When was the last time you heard about a real estate bubble, a market crash, or a “once-in-a-lifetime” economic shift , and your gut reaction was, “Yeah, but that’s not going to happen to me”?

That feeling has a name. Psychologists call it normaly bias. It's the reason people stayed in New Orleans. It's the reason people held tech stocks all the way down in 2000.

Here's how it works. Your brain looks around, sees that today looks roughly like yesterday, and concludes that tomorrow will look roughly like today.

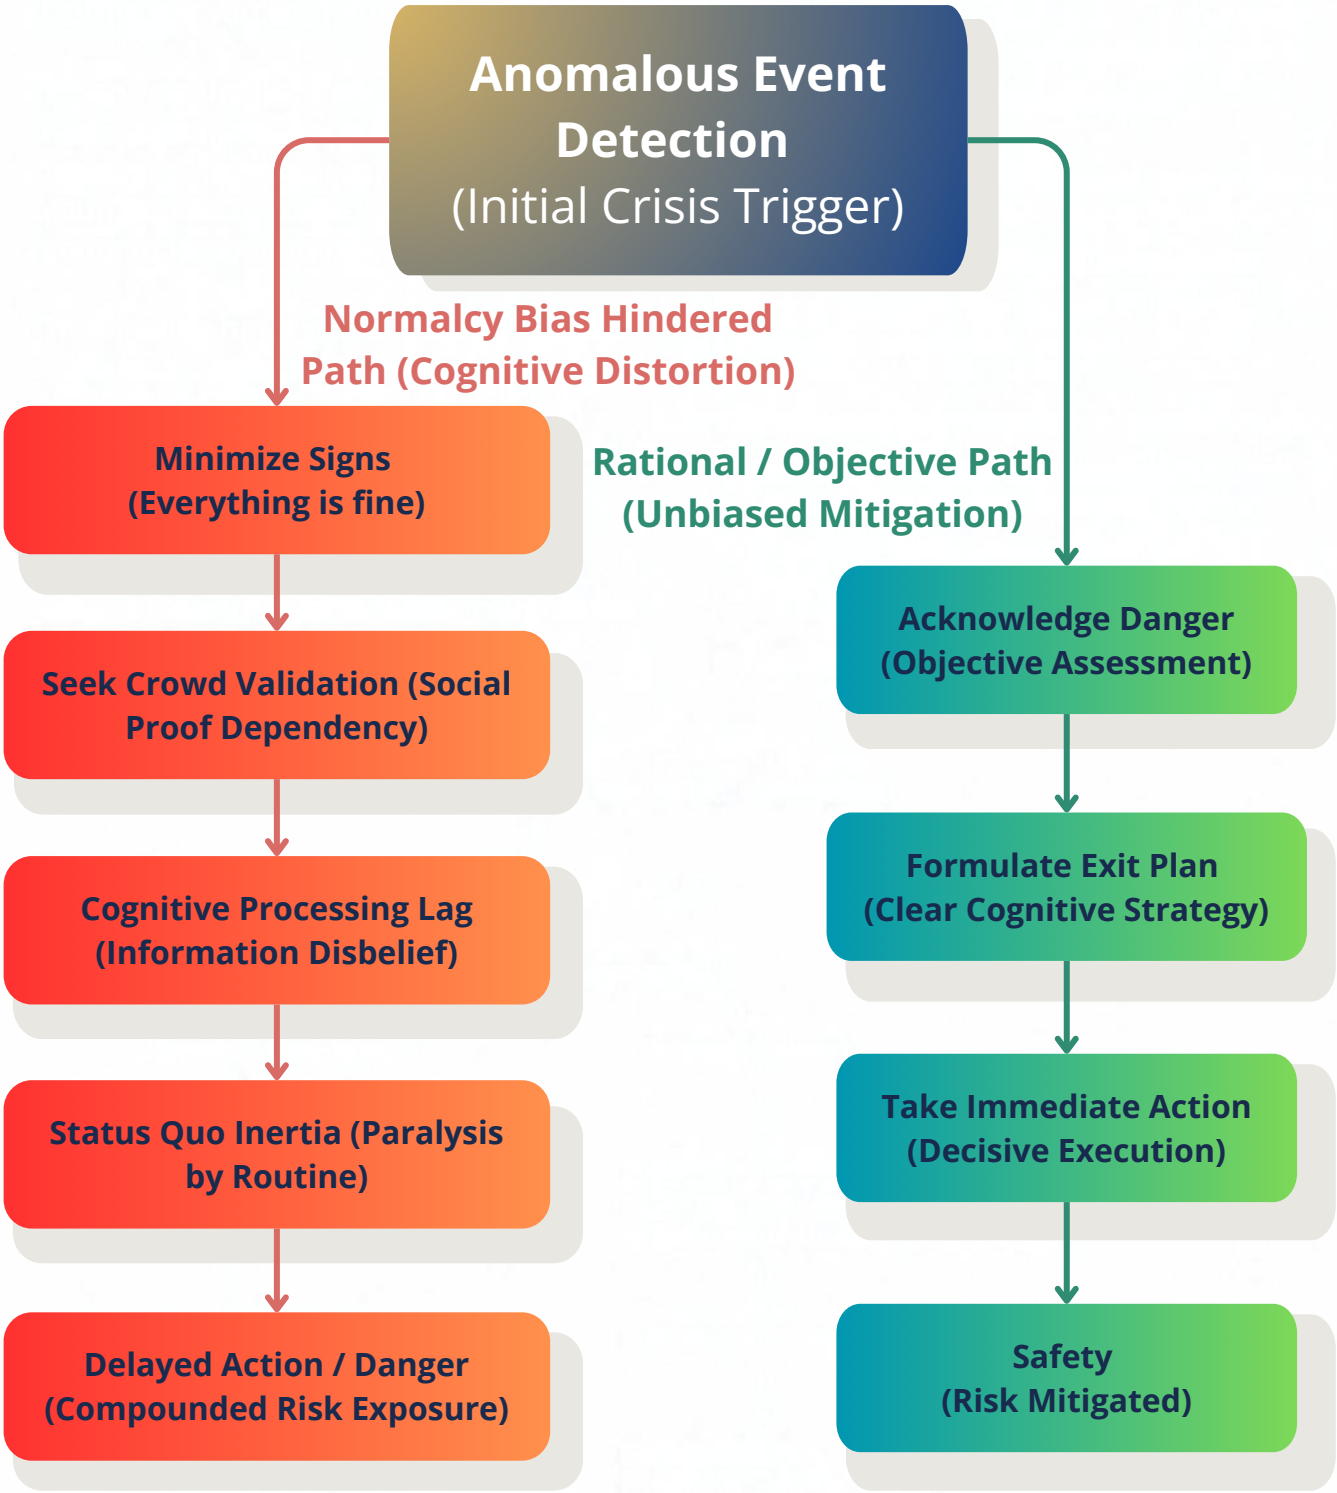

That's a useful shortcut most of the time. It's a deadly shortcut when the ground is actually moving under your feet.

The people who came through past crises with their savings intact weren't smarter than everyone else. They just took the warning signs seriously a year or two before the headlines made it official.

The question is not whether you're smart enough to see what's coming. The question is whether you're willing to act before everyone around you agrees that it's happening.

By then, the move is over.

Cognitive Path Divergence Under Normalcy Bias

PART 03

Why "This Time" Really Is Different

I know — "this time is different" is the most dangerous sentence in finance. But hear me out, because this is the tenth time.

Every previous wave of automation went after the same kind of work — repetitive, physical, predictable. The cotton gin replaced field hands. The assembly line replaced craftsmen. ATMs replaced bank tellers. Each wave was painful, but the displaced workers usually had somewhere to go — up the skill ladder, into office jobs, into the knowledge economy.

That escape hatch is what's closing. Artificial intelligence isn't aimed at the factory floor. It's aimed at the office.

Because every one of those white-collar workers is a customer. They buy the products your stocks make. They pay the mortgages your bond funds depend on. They fund the pensions your retirement plan inherits.

Two of the people running these companies have said this on the record, specifically: Anthropic CEO Dario Amodei told Axios in May 2025 that AI could eliminate up to half of entry-level white-collar jobs within five years.[7] Ford CEO Jim Farley told the Aspen Ideas Festival in June 2025 that AI "is going to replace literally half of all white-collar workers in the U.S." [8]

Believe them. They're not selling you anything by telling you that. They're saying it because they can see what's on their own development roadmap.

This isn't another tech cycle. This is the first time in history that the cheap, abundant resource is intelligence itself.

PART 04

The Wipeout That Could Take Down Your Portfolio

> **When folks ask me where to buy gold and silver, I give them one name: American Sovereign Bullion. They're the only company I recommend.**

Larry Kudlow

Host of Fox Business Network's "Kudlow"

Larry Kudlow is a paid spokesperson for American Sovereign Bullion

When you look at your 401(k) or your IRA statement, you don't see "the American economy." You see fund names. But what is actually inside those funds? It's companies. And what makes those companies profitable is tens of millions of well-paid white-collar professionals earning good salaries and spending them into the economy.

Field	What AI Is Already Doing
Law	Reviewing contracts, drafting briefs, summarizing case law, work that used to justify a junior associate's salary.
Finance	Building models, writing investment memos, generating earnings analysis.
Software	Writing, debugging, and shipping code across entire projects.
Marketing	Producing copy, campaigns, graphics, and full content strategies in minutes.
Healthcare	Reading scans, interpreting lab results, supporting diagnosis.
Customer Service	Handling multi-step, complex issues end-to-end through AI agents.

You'll hear people say, “Don't worry, AI will create new jobs.” Sure. It will. Prompt engineers. AI safety researchers. Data center technicians. But ask yourself how many of those jobs there will be, and whether they'll pay what the old ones paid.

Ask: what happens to the companies in your portfolio when their customers can't afford the prices they used to charge?

Margins compress. Earnings disappoint. Stock multiples come down. Dividends get cut.

This isn't a transition. It's a thinning. And it isn't just your neighbor's job that gets thinned out. It's the value of every paper asset that depends on those neighbors continuing to spend.

PART 05

The Permanent Wage-Loss Hole in the American Economy

Let me show you the math nobody on television is walking through.

According to the Social Security Administration, the National Average Wage Index for 2024 (the most recent year available) is $69,847. The U.S. civilian labor force is roughly 170 million people.[9] If even a low single-digit share of those jobs are compressed, automated, or eliminated over the next few years, the lost income runs into the hundreds of billions of dollars annually, and every additional percentage point adds tens of billions more. We won't hand you a single precise total figure, because no one has a reliable one yet; the point is the order of magnitude is large enough to matter to every paycheck-dependent institution in the country.

Think of consumer income like the oxygen in a room. You don't notice it when there's plenty. You notice it the second there isn't.

Pull a meaningful share of wages out of the system, and you don't just hurt the people who lost their jobs. You hurt:

- The bank that holds their mortgage
- The hospital that depended on their employer's insurance plan
- The retailer where they would have replaced their refrigerator
- The federal government that depended on their payroll tax
- The pension fund that depended on the stock of the company they used to buy from
- And the retiree whose 401(k) holds the stock of the company that used to sell to them

That last one is the part that matters most for you.

PART 06

Debt, Inflation, and the Printing Press

In 1970, the median American household earned about $8,730 a year. The national debt was about $370 billion. [10]

Today, the SSA's National Average Wage Index (2024) is $69,847.[11] The national debt is over $39 trillion — confirmed by U.S. Treasury data as of August 2026. [12]

Household income has risen roughly sevenfold since 1970. National debt has risen more than a hundredfold.

We are not running a normal economy. We are running an economy that has depended on more and more borrowed money to paper over the gap between what people earn and what the government spends. That was the system before AI started affecting jobs.

This is not a partisan point. This is arithmetic.

And it's why a piece of your wealth — some piece, however small — needs to live outside the paper system entirely.

PART 07

The 2028 Scenario That Should Keep You Up at Night

June 2027: Self-Improving AI

A widely discussed forecasting exercise called AI 2027, written by researchers Daniel Kokotajlo, Scott Alexander, Thomas Larsen, Eli Lifland, and Romeo Dean, lays out one plausible month-by-month path for frontier AI development.[13] The authors describe it as their best guess at a scenario, built to be concrete enough to argue with — not a guarantee. Its central mechanism: once AI systems become good enough to meaningfully help build the next generation of AI, progress stops being limited mainly by the number of human researchers and starts being limited by available computing power, which has roughly doubled every twelve to eighteen months. The scenario describes AI labs reaching a point where the most capable systems effectively help direct their own improvement, under human oversight that grows thinner by the month, and a parallel dynamic in which competing nations race to close the resulting capability gap.

Whether or not every date in that scenario proves accurate, a number of AI lab leaders, including Anthropic's Dario Amodei, have described this compute-driven, self-reinforcing dynamic in public remarks. That's the part of the argument we're comfortable standing behind: not a specific timeline, but the direction of travel.

The "Ghost GDP" Scenario

Citrini Research founder James Van Geelen and technologist Alap Shah co-authored an essay titled "The 2028 Global Intelligence Crisis," which the authors themselves frame explicitly as a thought experiment, not a prediction.[14]

Their scenario: AI adoption boosts corporate margins sharply and markets celebrate. Then unemployment rises in unexpected places — tech corridors, law-firm towns, finance hubs. Prime borrowers with strong credit start missing mortgage payments because the high-income jobs that justified those mortgages disappeared. Equity markets reprice sharply, because you can't have a stock market without consumers, and you can't have consumers without wages.

The authors call the disconnect "Ghost GDP" — output that looks fine in the national accounts while the income that used to reach ordinary households increasingly doesn't.

We're presenting this the way its authors do: as a model worth thinking through, not a forecast. But ask yourself how much of it would have to come true before your retirement plan is in trouble — and whether, at your age, you have time to find out the hard way.

PART 08

When the Friction Goes to Zero

A huge portion of corporate profits in this country are built on human inattention. We forget to cancel subscriptions. We don't re-shop our car insurance every year. We click the same delivery app instead of comparison shopping.

Now imagine an AI agent working for you 24 hours a day that never forgets, never gets tired, and never settles for the convenient option.

Business Model	What It Quietly Depends On	What an AI Agent Does to It
Subscriptions	You forgetting to cancel	Cancels everything you don't use, every month
Travel booking	Planning is annoying	Builds a better trip in seconds, for less
Insurance	You don't re-shop yearly	Re-shops every renewal, every policy
Delivery apps	You always pick the same one	Compares every option for every order

Multiply this across every industry built on consumer friction, and some of the biggest, safest-looking “blue chip” businesses in your stock portfolio might be more exposed than the analysts think.

This isn't just a job story. It's a margin story. And margins are what your retirement account is built on.

PART 09

The Mortgage Question: Why Your Home Equity Carries Risk Too

In 2008, the mortgage problem was a credit problem, bad loans from day one. The next mortgage problem, if it comes, would look different: prime borrowers, high credit scores, full documentation. And then, a couple years after origination, the borrower's industry gets compressed, and the mortgage that was easy to carry becomes hard to carry.

Multiply that across hundreds of thousands of borrowers concentrated in a handful of cities, and you have a housing problem that becomes visible over time rather than on day one.

Now think about what that means for your house.

If you're 60-something with a paid-off home, you're not the borrower in trouble. But you live in the same housing market. If a local employer pulls back because its workforce is being automated, the bidding pool for your home shrinks.

The 2008 crisis hit the bad borrowers. A future one could hit the responsible ones too, simply for sharing a ZIP code.

A Story From Our Phones

"She was 71. A widow for four years. Roughly $1.1 million between her IRA and a taxable account. She wanted to take a portion, about 15% of her IRA, and move it into physical gold and silver, held outside the bank system, with a clean inheritance path to her kids. It took three calls. She told us she finally slept through the night."

If you're protecting a legacy, not just a portfolio, this call is for you.
(844) 272-2428.

PART 10

The Alarm Bells Have Already Been Ringing

In March 2023, Goldman Sachs published a research report (Briggs & Kodnani) estimating that generative AI could expose roughly 300 million jobs worldwide to some degree of automation, with office and administrative support, legal, engineering, and financial operations near the top of the exposure list.[15]

- **The World Economic Forum's Future of Jobs** reports project significant net job displacement from automation and AI. [16]
- **Ford CEO Jim Farley** told the Ideas Festival in June 2025 that AI is "going to replace literally half of all white-collar workers in the U.S." [17]
- **Anthropic CEO Dario Amodei** told Axios in May 2025 that AI could eliminate up to half of entry-level white-collar jobs within five years. [18]
- **Fortune, Business Insider, CNBC, the Financial Times, and Bloomberg** have tracked layoffs at major companies that executives explicitly tied to AI productivity gains.

These are not gold dealers ringing the alarm. These are the people who run the system telling you what they see from the inside.

What We Know vs. What We're Hoping

Ever heard the saying, "Hope causes inaction"
What we know:

- The technology works, and it is improving quickly.
- The largest technology companies are investing nearly a trillion dollars annually to make it more capable. These companies are literally in a race against each other, and China for supremely dominant super powerful capabilities.
- Several of their own CEOs have said, on the record, that this includes the kind of work knowledge workers do.
- Corporations adopt new technology when it lowers costs.

What we're hoping:

- That the economy creates enough new jobs to absorb everyone displaced. That's purely hope.
- That those jobs pay as well as the old ones.
- That the transition is slow enough for retraining to keep up.
- That your retirement account will somehow be spared the consequences.

Hope is not a plan. In the military they often say…*"failing to plan is planning to fail."*

One More Before We Move On

One More Before We Move On (Illustrative — names, details, and specifics changed.) "Retired federal employee in his late sixties. $600,000 in his TSP, mostly S&P index funds. He thought he had to take a distribution and pay taxes to move into metals. He didn't. Took about thirty days, no taxable event."

If you don't know how exposed your retirement is, you owe yourself this call. (844) 272-2428.

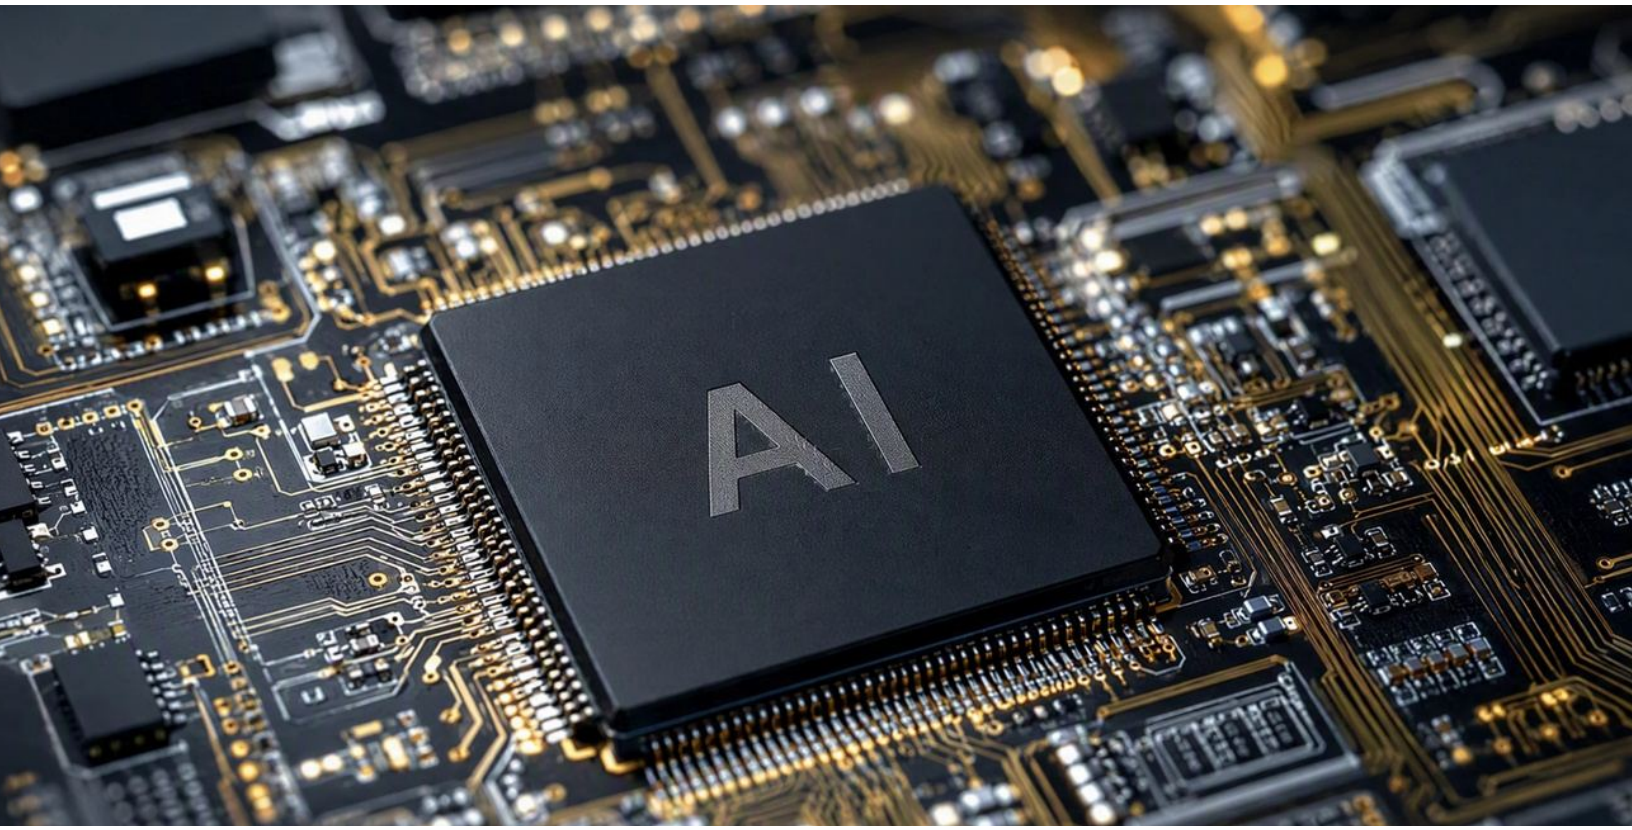

PART 12

The Machine That Builds the Machine

Leading AI labs have begun openly discussing how AI is helping them build the next generation of AI, assisting with debugging, writing parts of its own training pipeline, evaluating its own performance.

Once AI starts meaningfully helping design the next AI, the capability curve can move faster than most institutions, including regulators and financial markets, are built to adjust to.

When you hear someone say "AI is moving faster than expected," they usually mean exactly that.

The Last Inefficiency Left to Eliminate

The entire history of industrial progress is about replacing expensive, inconsistent, fragile inputs with cheap, consistent, scalable ones. Steam replaced muscle. Electricity replaced steam. Software replaced paper.

The last expensive, fragile input left in a lot of businesses is the human worker , especially the high-wage knowledge worker. That's not a moral statement. It's how a CEO with a fiduciary duty looks at a balance sheet.

Don't wait for the government to fix the transition for you. Plan accordingly.

The Give Behind Every Take

For nearly all of our time on two legs, everything we needed for life came straight from the rivers and the woods. Only in the last century or so has that changed, now the resource we need first is money, an elusive stand-in we must acquire before we can acquire what once came to us directly. I'm not against air conditioning or grocery stores. But every "take" has a "give." Up requires down. Right requires left.

The need to earn money before we can reach what used to be ours by direct access means money has become a gatekeeper , an obstacle standing between us and the resources themselves. Humanity has migrated from direct connection to life's support systems into dependency on a precursor to them. Money now sits between us and God's world.

If necessity is the mother of invention, then AI is the god-like creation that will dismantle , technologically, and so artificially , our dependency on money-gated access to resources. It can move us from where we are now back toward what once was: an ecosystem we can depend on again to fetch what we need to live. An essentially cost-free workforce.

AI is the solution we're building for the dysfunction we built , the one that decoupled humanity from God and from God's world, where the Earth is plentiful in every regard.

PART 14

Why Gold Belongs in This Conversation

"American Sovereign Bullion is the only company I recommend for physical gold and silver and I don't lend my name to anyone I don't trust

Larry Kudlow

Host of Fox Business Network's "Kudlow"

Larry Kudlow is a paid spokesperson for American Sovereign Bullion

We're a gold and silver company. Of course we think you should own bullion. Here's why we wrote this guide instead of just sending you a price sheet: the case for owning physical precious metals has never been stronger, and most Americans approaching retirement still don't understand why.

- Your 401(k) and IRA depend on the stock market staying up.
- The stock market depends on corporate earnings, which depend on consumer spending, which depends on wages.
- Your Social Security depends on payroll tax receipts.
- The dollar in your bank account depends on the government not having to print trillions of new ones.

Every single link in that chain is exposed to the same shock.

Physical gold and silver are different. They aren't a company's earnings forecast, a stock multiple, or a promise from your employer or government. They are the asset humans have used as money for five thousand years, sitting in a secure depository, owned by you, with no counterparty.

The Risk	Why Paper Assets Are Exposed	Why Physical Bullion Is Different
White-collar income shock	Equities depend on consumer wages	Gold doesn't depend on anyone's paycheck
Government printing	Cash and bonds lose purchasing power	Gold has historically gained when currencies weaken
Stock market re-pricing	Your IRA is one bad year from a haircut you can't outwait	Bullion moves on a different cycle
Housing income shock	Home equity depends on jobs in your ZIP code	Gold sits outside the local economy
Estate and inheritance	Paper assets depend on institutions surviving	Bullion can pass cleanly to your heirs

We're not telling you to sell everything and buy gold.

We're telling you that if you have zero holdings in the one asset class designed to survive what this guide describes, you are not diversified.

You are exposed.

PART 15

Your Action Plan, Before the Window Closes

1

Stop denying

Accept that AI may hit the companies in your portfolio sooner and harder than the financial news is telling you.

2

Cut the debt that can hurt you

Variable-rate debt, credit card balances, any line of credit tied to your home.

3

Build liquidity

Cash on hand — enough to cover a year of expenses without selling into a down market.

4

Audit your retirement accounts honestly

How much of my wealth gets hit if these scenarios play out even partially? How much time do I have to recover?

5

Move a portion, not all, a portion, into physical precious metals

Outside the paper system, in your name or in a precious-metals IRA you control.

6

Make the call today

(844) 272-2428. Ask for a senior bullion specialist and mention you just finished reading A.I. Wrecked World.

No One Likes Wearing Life Preservers on Water... Until You Are Wet

"You'll Experience What is Coming, Dictated by Where Your Savings was Located When it Begins"

Where your savings, your life savings, is located, will dictate how you experience what seems quite likely to come. There are perhaps four locations for your savings:

- CASH in a safe at home
- REAL ESTATE Farmland
- FINANCIAL WORLD Printed appreciation? Air?
- THE VAULT or DEPOSITORY Actual metal money

Humans wait to react to change instead of creating it early because our brains prefer the safety of what is familiar.

A Story From A Phone Call with Us

“He was 67. Retired six years from a senior engineering job. About $850,000 across his IRA and a separate brokerage account. He'd watched the market lose almost 40% in 2008, drop again in 2020, and another 25% in 2022. At 67, he figured he had maybe one more recovery cycle in him.

“We walked him through how a portion of his existing IRA could roll into a precious-metals IRA without triggering a single dollar of tax. He started the rollover the following month.”

If you've already lived through two or three of these market drops and you don't want to live through a fourth , call (844) 272-2428.

American Sovereign Bullion

What the Free Consultation Actually Is

- A 30-to-45-minute phone call with a senior bullion specialist.
- No obligation.
- No pressure.
- If we're not a fit, they'll tell you and hang up.
- If you're married, bring your spouse on the call.

Why You Can Trust This Call

- You will speak with a senior bullion specialist, not a commission-driven closer.
- We tell you our pricing on the first call.
- We focus on standard, IRS-eligible bullion products , not exotic, high-markup “rare” or “proof” coins.
- Your metals are stored at an IRS-eligible, non-bank depository in your name, fully insured.
- You are never under any obligation to buy anything.

The Call

(844) 272-2428

A senior bullion specialist will answer.
You don't need to know what to ask, or be ready to decide anything.

You just need to pick up the phone.
